What are releases and versions?

Versions represent points in time for your project. They can be used to schedule how features are rolled out to your customers, or as a way to organize work that has been completed for the project.

In Jira, versions are managed in the Releases hub.

When you enable releases, the following will happen:

- The **Fix versions** field will be added to all issue types in your Jira project.
- A new option will appear in the project menu: **Releases**. This is where you can manage your versions.

Versions are handled differently in Scrum and Kanban projects. A version in a Scrum project is *not released* until it is released when the release is ready.
